No.	Requirement	MoSCoW Category	Impact on Users / Stakeholders	Feasibility (Time, Budget, Resources)	Justification
1	Search books by title and author	**Must-Have**	High: Core library function that helps users find books quickly and supports daily librarian work.	High: Straightforward to implement with a searchable catalogue and basic database queries.	Essential for the system's primary purpose; relatively low cost and effort.
2	Online book reservation system	**Must-Have**	High: Lets users reserve unavailable or desired books and helps librarians manage demand.	Medium–High: Requires reservation status, availability checks, and user accounts, but uses standard web-app functionality.	A key user service and a practical core workflow for a modern library system.
3	Monthly reports on borrowed books for administrators	**Must-Have**	High: Administrators need borrowing summaries to monitor usage and make decisions.	High: Can be built from borrowing records using date filters and report exports.	Supports routine administration and accountability with manageable implementation effort.
4	Email notifications for overdue books	**Should-Have**	Medium–High: Reminds users to return books and can reduce late returns and follow-up work.	Medium: Needs email service integration, scheduled checks, and valid user email addresses.	Valuable, but the system can operate initially with manual overdue tracking.
5	QR code scanning for borrowing and returning books	**Could-Have**	Medium: Could speed up circulation and reduce manual entry, especially in busy libraries.	Medium–Low: Requires QR generation, compatible scanning devices or phone cameras, and testing.	Useful enhancement, but standard barcode/manual workflows can support the first release.
6	User-friendly dashboard for librarians	**Must-Have**	High: Gives librarians a clear view of loans, returns, reservations, and overdue items.	High: A basic dashboard can be developed using existing system data and standard UI components.	A usable interface is necessary for efficient daily operation; advanced visualizations can come later.
7	Users can review and rate books	**Could-Have**	Low–Medium: Helps users share opinions and discover popular books, but is not required for circulation.	Medium: Requires rating/review storage, moderation, and controls against misuse.	Adds community value but can be postponed until core library workflows are stable.
8	Chatbot for user assistance	**Won't-Have (initial release)**	Medium: Could answer common questions, but users can still get help through normal contact or FAQ pages.	Low–Medium: A reliable chatbot may require integration, content maintenance, testing, and extra cost.	Excluded from the initial scope to protect time and budget; reconsider in a later phase if resources allow.
9	Mobile app version of the system	**Won't-Have (initial release)**	High potential: Convenient mobile access, but a responsive website can serve users across devices initially.	Low–Medium: Separate iOS/Android apps add development, testing, deployment, and maintenance effort.	Defer a dedicated app due to resource constraints; prioritize a mobile-friendly web interface first.
10	Multi-language support	**Should-Have**	Medium–High: Makes the system more accessible to users who prefer different languages.	Medium: Requires translated interface text and ongoing maintenance, but can be introduced for selected languages.	Important for inclusivity, but the first release can launch in one primary language and add translations next.
